

RETAIL ANALYTICS · MANAGEMENT VIEW

Customer Shopping Behaviour Analysis

Turning retail data into actionable business insights for management decisions.

THE BUSINESS QUESTION

Management needs a sharper view of where purchase value comes from

01	02	03	04	05
3,900 records	SQL analysis	Visualisation	Implications	Controlled tests
18 fields	Structure the evidence	See the patterns	Translate to decisions	Turn evidence into learning

Scope: recorded purchase value — not profit, ROI, retention or lifetime value.

OVERALL PERFORMANCE

\$233,081
recorded
purchase
value sets a
\$59.76 baseline

Overall performance is healthy enough to prioritise experiments, but average differences are modest and should be validated rather than over-interpreted.

Clothing and Accessories together represent about 76.5% of recorded value.

Executive KPIs · values shown exactly as recorded

CATEGORY AND PRODUCT MIX

Clothing and Accessories carry the commercial centre of gravity

Category contribution · purchase value (\$)

Top items: Blouse \$10,410 · Shirt \$10,332 · Dress \$10,320 · Pants \$10,090 · Jewelry \$10,010

Average category value: Footwear leads at \$60.26, followed closely by Clothing at \$60.03.

Inventory signal: Medium is the most purchased size at 1,755 records; Olive leads at 177.

Implication: scale opportunities sit in the two largest categories; Footwear is a candidate for volume building tests.

Volume explains more of the gap than customer identity

Total value follows audience size; average values stay close across segments.

Age: 55+ contributes the highest total at \$69,590 across 1,178 records; ages 45–54 lead average value at \$60.33.

Gender: female averages \$60.25 versus \$59.54 for male customers; male total is larger because there are more records.

Subscription: non-subscribers contribute \$170,436 versus \$62,645; averages are nearly identical at \$59.87 and \$59.49.

Descriptive differences are not evidence that demographics or subscription status cause spend.

Some smaller markets spend more per record

Opportunity group	Location · records · average purchase value
High volume / lower average	California — 95 records at \$59.00; Alabama — 89 records at \$59.11; Minnesota — 88 records at \$56.56
Lower volume / higher average	Alaska — 72 records at \$67.60; Pennsylvania — 74 records at \$66.57; Arizona — 65 records at \$66.55

Highest total locations

Montana \$5,784; Illinois \$5,617; California \$5,605.

Implication

Use a volume × average-value view to prioritise local basket-building and acquisition experiments, not a league table alone.

Promotion and operations remain hypotheses to test

Promotion status	Records	Average purchase value (\$)
No discount / no promo code	2,223	60.13
Discount / promo code	1,677	59.28

Discounts: a \$0.85 gap. **Promo codes:** the same averages are reported.

Supported: describe usage and association, but do not claim incremental lift or profitability.

Open: seasonal comparisons, shipping and payment relationships need dashboard exploration or additional validated result tables before drawing conclusions.

Three controlled tests can turn evidence into growth learning

1. **Cross-sell Clothing and Accessories:** Build complementary recommendations around Blouse, Shirt and Dress; track average purchase value, total purchase value and units per order against a holdout.
2. **Build baskets locally:** Test bundles or threshold offers in California, Alabama and Minnesota; compare against a matched baseline and account for discount cost when available.
3. **Target by behaviour, then validate:** Test age/gender/category recommendations and evaluate subscriber engagement separately; scale only on incremental lift.

Success line: Each action is an investigation, not a guaranteed outcome.

MANAGEMENT TAKEAWAY

Scale where the data is concentrated, learn where the signal is strongest

Top five insights: \$233,081 total value; Clothing and Accessories are 76.5% of value; Blouse leads item totals; location averages vary more than totals; promotion differences are small

Monitor: category mix, product ratings, local basket value, subscriber engagement and incremental lift.

Cannot establish yet: profitability, marketing ROI, month-over-month growth, retention and customer lifetime value.

Next step: add dates, order IDs, product cost, promotion cost, returns and customer-level history to connect sales patterns to commercial impact.

Management takeaway: prioritise experiments around the existing value engine, then scale only where controlled evidence proves the economics.
